Assignment 1 - Git & GitHub Fundamentals

Report Template

- ***Full Name: Hamza Ifleh***
- ***Student ID: 163348***
- ***Course Code & Section: CSC 3324 03***
- ***GitHub Username: @HamzaIfleh***

1. Repository Setup

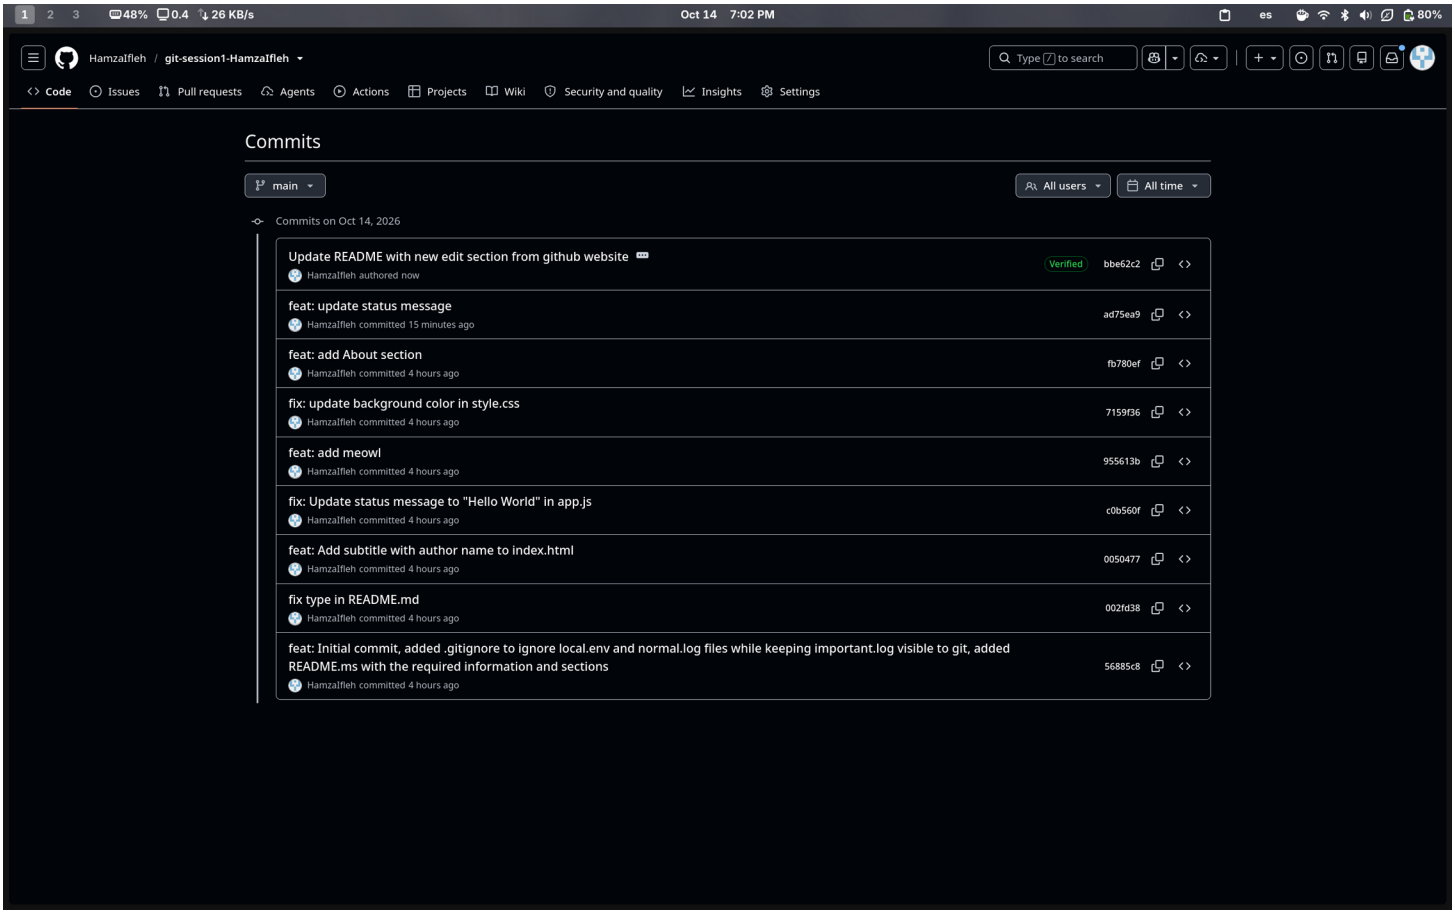

*I initialized the starter project as a Git repository using git init. In .gitignore, I added *.env to ignore environment files such as local.env, and *.log to ignore log files. I added !important.log as an exception so that Git could track that file.*

2. README & Commit History

My README includes my name, GitHub username, a short description, technologies, a code block, a link, and the provided image. I organized my work into these commits:

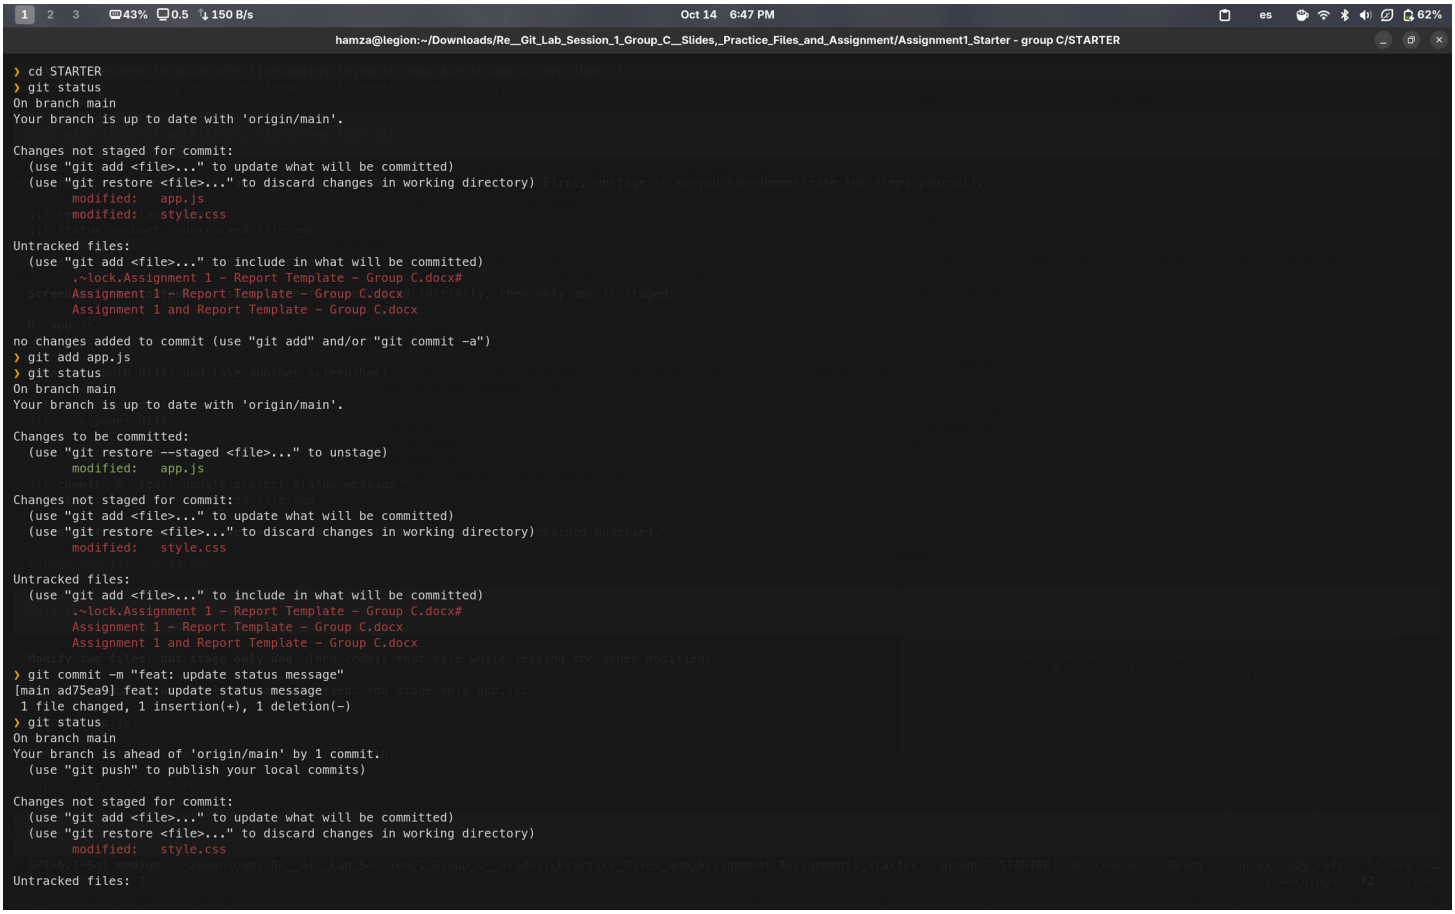

- The initial commit added the starter files, README, and `.gitignore`.
- `fix type in README.md` corrected a typo in the README.
- `feat: Add subtitle with author name to index.html` added my name to the page.
- `fix: Update status message to "Hello World" in app.js` changed the status message.
- `feat: add meowl` added an image.
- `fix: update background color in style.css` changed the background color.
- `feat: add About section` added the About section and its styling on the `feat/about` branch. I then switched to `main` and merged that branch.

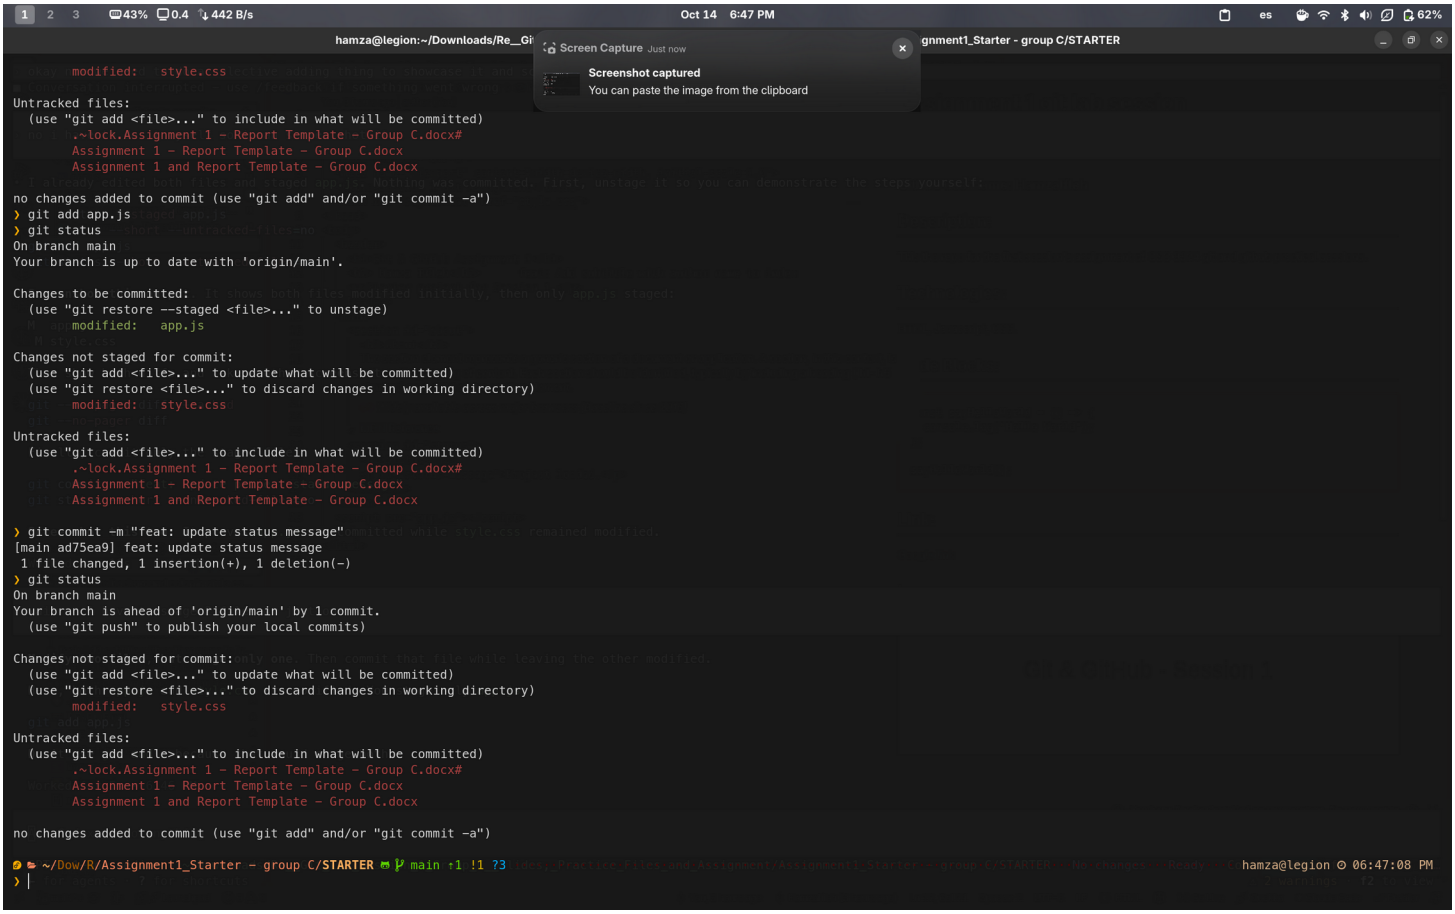

The commit messages describe what changed, with `feat:` for additions and `fix:` for corrections.

3. Selective Staging

I modified app.js and style.css, then used git add app.js to stage only app.js. I checked git status to see the staged and unstaged changes. I committed app.js while leaving style.css modified.

Assignment 1 and Report Template - Group C.docx
❯ git commit -m "feat: update status message"
[main ad75ea9] feat: update status message
1 file changed, 1 insertion(+), 1 deletion(-)
❯ git status
On branch main
Your branch is ahead of 'origin/main' by 1 commit.
(use "git push" to publish your local commits)
Changes not staged for commit:
(use "git add <file>..." to update what will be committed)
(use "git restore <file>..." to discard changes in working directory)
modified: style.css
Untracked files:

4. Branch & Merge

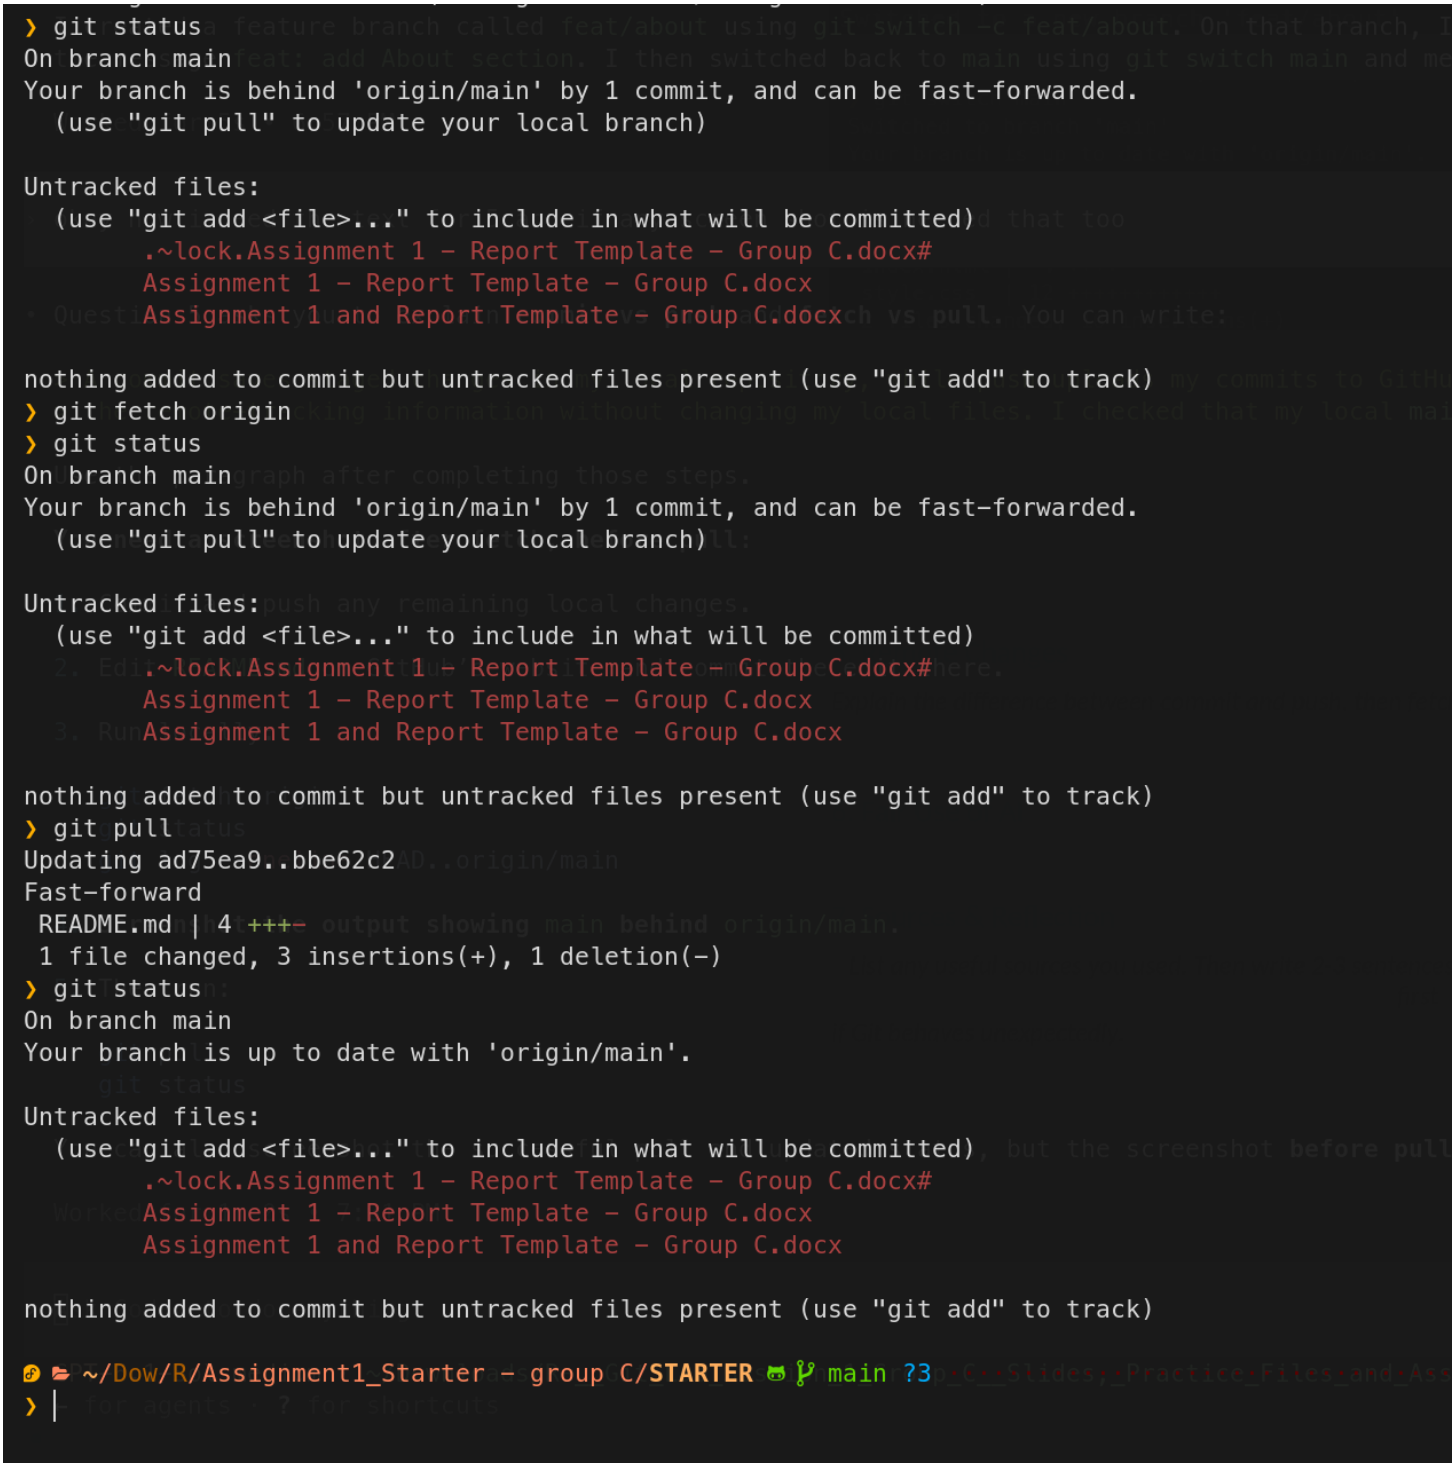

I created a feature branch called `feat/about` using `git switch -c feat/about`. On that branch, I added an About section in `index.html` and its styling in `style.css`. I committed both changes with the message `feat: add About section`. I then switched back to `main` using `git switch main` and merged the feature using `git merge feat/about`. Git completed a fast-forward merge.

```
❯ git switch -c feat/about
Switched to a new branch 'feat/about'
```

```
❯ git switch main
Switched to branch 'main'
Your branch is up to date with 'origin/main'.
❯ git merge feat/about
Updating 7159f36..fb780ef
Fast-forward
 index.html |  4 ++++
 style.css  | 12 ++++++++++++
 2 files changed, 16 insertions(+)
```

5. Remote Changes

A commit saves staged changes in my local repository, while push uploads my commits to GitHub. I edited and committed the README directly on GitHub, then ran git fetch origin. Fetch updated the remote-tracking information without changing my local files. I checked that my local main was behind origin/main, then ran git pull to bring the remote change into my local branch.

6. Fair Use of AI

I used AI to generate an editable docx from the pdf so that I can write my answers in it. I also used it to help me write the text answers. I did not use AI with git or with code changes.

7. Sources & Reflection

I used the slides provided in the assignment. I would check git status and git log to understand what happened if something behaved unexpectedly.
